

**IT IS NOT THE AI.
IT IS THE CONTEXT.**

A short conversation before we build.

The problem

Generic in, generic out

Most people paste a question into a chat box and get generic help, because the tool has no idea who they are. It guesses from the average of the internet, and you spend the next hour correcting it.

The fix

Give it your context, once

Set up who you are, your research, your record, your institution, one time. From then on every answer is grounded in you, not in a stranger's guess.

Grounded beats generic

Better output. It uses your real record, not filler.

Less back and forth. Fewer corrections, fewer re-explanations.

Lower cost. Fewer wasted tokens means less money spent.

Same page

The words we will use

AI vs LLM. AI is the field; an LLM is the text-trained model we use.

Chatbot vs agent. A chatbot replies; an agent takes steps and uses tools.

Prompt, skill, workspace. What you ask, a saved instruction, and your context plus skills in one place.

Same page

Tokens and the context window

Tokens. The pieces of text the model reads and writes. You pay per token.

Context window. How much it can hold in mind at once.

The payoff. Good context means you say things once, not every time. That saves tokens, and money.

Same page

Why it makes things up, and the fix

It predicts. A model writes likely text, so it will invent a citation that looks right.

Grounding. Give it real sources and tell it to use only those.

Here. That is what the literature folder in your workspace is for.

Good habits

Set it up to win

Context first. Tell it who you are before you ask for anything.

Be specific. State the goal, the audience, and the length.

Point to the rubric. Give it the review criteria to hit.

Good habits

Keep it honest

Ground every claim. Tie it to a real source you provided.

Trust nothing unverified. Check every citation and statistic yourself.

Let it say I do not know. If it cannot support a claim, it should flag it, not fake it.

Good habits

You drive

You decide. The AI accelerates; the judgment stays yours.

Iterate. Draft, react, refine. The first pass is a starting point.

Verify. Check every number, date, and name before it goes out.

This is how the workspace works

Context in, grounded help out. You are about to open a workspace built on exactly these ideas.

Let's build.

**Fill in your context once.
Reuse it on every proposal.**
